**Remarks on delta-convex functions.** (English) Zbl 0714.46007  
Commentat. Math. Univ. Carol. 31, No. 3, 501-510 (1990).

Let  $A$  be a convex subset of a normed linear space  $X$ . A function  $H: A \rightarrow \mathbb{R}$  is delta-convex on  $A$  if it can be expressed as a difference of two continuous convex functions on  $A$ . A function  $h: A \rightarrow \mathbb{R}$  is a control function to  $H$  on  $A$  if  $h-H$  and  $h+H$  are continuous and convex.

The authors give an example of a delta-convex function on  $\mathbb{R}^2$  which is strictly differentiable at 0, but none of its control functions is differentiable at 0. They also generalize to infinite-dimensional spaces a result of Hartman on the existence of a control function for a family of functions.
