**Local constancy in  $p$ -adic families of Galois representations.** (English) Zbl 0932.32028  
*Math. Z.* 230, No. 3, 569-593 (1999).

Let  $K$  be a field complete with respect to a non-archimedean norm, of residue characteristic  $p$ . Let  $X$  be a quasi-compact rigid space and  $Z$  a closed subspace.

A substantial part of the paper deals with the question when there exists a relative tubular neighbourhood  $U$  of  $Z$  in  $X$ . This essentially means that  $U$  is an admissible open containing  $Z$  and any Galois prime to  $p$  covering  $\mathcal{E}$  of  $X$  whose restriction to  $Z$  is split, is also split over  $U$ , possibly after a finite extension of scalars. If  $X$  is smooth and  $Z$  has normal crossings, then such a relative tubular neighbourhood exists. The author therefore conjectures a rigid analogue of de Jong's resolution of singularities [*A. J. de Jong*, *Publ. Math., Inst. Hautes Etud. Sci.* 83, 51-93 (1996; [Zbl 0916.14005](#))], and then shows that under this hypothesis, any pair  $(X, Z)$  admits a relative tubular neighbourhood. In particular, if the characteristic of  $K$  is zero or if  $X$  is the analytization of a scheme of finite type over  $K$ , then no assumption is needed. The main application of this work is the following. Let  $X$  be a scheme of finite type over  $K$  and let  $\mathcal{L}$  be a local system which is either induced by an étale covering of  $X$  or is a lisse sheaf of free  $\mathbf{Z}_l$ -modules (with  $l \neq p$ ). For each rational point  $x \in X$ , let

$$\rho_x \text{Gal}(\overline{K}/K) \rightarrow \text{Aut}(\mathcal{L}_x)$$

be the induced representation of the absolute Galois group. Then there exists a  $p$ -adic neighbourhood  $U$  of  $x$ , such that for each rational point  $y \in U$ , we have  $\rho_x \cong \rho_y$ . In particular, if  $F$  is discretely valued with finite residue field, then only finitely many non-isomorphic Galois representations can arise.
