Blanchette, Jasmin Christian; Popescu, Andrei; Traytel, Dmitriy
Unified classical logic completeness. A coinductive pearl. (English) Zbl 1409.68250

Summary: Codatatypes are absent from many programming and specification languages. We make a case for their importance by revisiting a classical result: the completeness theorem for first-order logic established through a Gentzen system. The core of the proof establishes an abstract property of possibly infinite derivation trees, independently of the concrete syntax or inference rules. This separation of concerns simplifies the presentation. The abstract proof can be instantiated for a wide range of Gentzen and tableau systems as well as various flavors of first-order logic. The corresponding Isabelle/HOL formalization demonstrates the recently introduced support for codatatypes and the Haskell code generator.

For the entire collection see Zbl 1293.68021.
